Marks JD, Amersdorfer P;

WPI; 2004-652009/63.

New isolated antibody that neutralizes botulinum neurotoxin type A, useful for diagnosing botulism or for treating pathologies associated with botulinum neurotoxin poisoning.

Example 1; SEQ ID NO 89; 110pp; English.

XX IIGH The invention describes an isolated antibody (I) that specifically binds to an epitope specifically bound by an antibody expressed by a specific clone where (I) binds to and neutralises botulinum neurotoxin type A (BoNT/A). An isolated antibody (I) that specifically binds to an epitope specifically bound by an antibody expressed by a clone chosen from clone 25, C25, C39, IC6, 3D12, B4, IF3, huC25, A1, A22, WR1(V), WR1(T), 3-1, 3-8, 3-10 and ING1, where (I) binds to and neutralizes botulinum neurotoxin type A (BoNT/A). Also described are: a polypeptide (II) comprising BoNT/A neutralising epitope having an epitope that is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              specifically bound by an antibody expressed by clones as mentioned in (I) producing (I); and a composition (III) comprising several anti-
composition metal composition comprising several anti-
condition metal antibodies, where each antibody is specific for a
different epicope of a botulinum neurotoxin and the combination of
antibodies shows greater toxin neutralisation than the single antibodies
comprising (I); and a kit comprising (I). (I) is useful for neutralising
comprising (I); and a kit comprising (I) is useful for neutralising
BONT/A antibody and for neutralising a botulinum neurotoxin which
comprising (I); and a kit comprising (I) in surplus, where each of (I) is
specific for a different epitope of the botulinum neurotoxin and the
combination of antibodies shows greater toxin neutralisation than the
single antibodies in surplus. (I) is useful for diagnosing the botulism
or for treating pathologies associated with botulinum neurotoxin
cor for treating pathologies associated with botulinum neurotoxin
considered to a mouse light chain variable fragment anti-botulinum toxin
core.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

They may also be used in a pharmaceutical compostion for the therapy of e.g. melanomas, gliomas and carcinomas. The antibodies and fragments are derived from mice but are humanised so as to cause minimum reaction against them. They are produced using the phage antibody library
                                                                                               Producing members of specific binding pairs - by expression in recombinant host cells with a secreting replicable genetic display

CC The VK sequence is one of 23 (AAR21286-308) expressed from a single chain CC Pv library. The library produces a diverse repertoire of antibody CC cDNA generated from maNA from mice immunised with phox coupled to chicked Serum albumin. The VH and VL kappa sequences were separately amplified by PCR (AAQ23474-84) and ligated into fdCR12 (AAQ23463) for expression on CC the phage surface as fusions with gene III. The resulting library of CC clones was diverse; 23 hapten binding clones were sequenced revealing 8 CC VH genes (A-H; AAR21264-71) in a variety of pairings with 7 VK genes (a-g; AAR21286-92). Most clones were by "crossing" VH-B with the VK clones sequenced. 14 new partners (AAR21293-308) for the VH-B combinations so a further CC clones sequenced. 14 new partners (AAR21293-308) for VH-B were CC dientified. Nearly all the VK genes were "ox-like"; only f, (from the CC original library) and h, p, q, and r (from the hierarchical library) were CC values found. This suggests that phage bearing scFv fragments having weak affinit- ies can be selected with antigen, probably due to the avidity of the multiple antibody heads on the phage. The different combinations CC could also be isolated on a basis of antigen affinity. See also AAR21260-307, 309-311; AAR22450, 565-581

                                                                                                                                                                                                                                                      CT This invention describes a novel cell-targeting vector (A) containing a CC DNA sequence (I) encoding a single-chain variable antibody fragment CC (scFv). The products of the invention have antiviral, cytostatic and cc immunostimulant activity and can be used in gene therapy, immunization CC and diagnosis particularly of T cell-associated diseases, specifically CC deficiency (SCID) or T cell lymphoma. (A) target T cells, independently CC deficiency (SCID) or T cell lymphoma. (A) target T cells, independently CC designated 7A5 encodes a 329 amino acid single-chain variable antibody CC designated 7A5 encodes a 329 amino acid single-chain variable antibody CC (squipe osteosarcoma cells susceptible to spleen necrosis virus CC (SNV)) cells, C8166 (human T lymphocyte) cells, and HeLa (human cervical CC (SNV)) cells. After 48 hours, the cells were stained with X-gal to CC carcinoma) cells. After 48 hours, the cells were stained with X-gal to CC showing the high selectivity for human T cells. This sequence represents CC the SNV-env leader/human 7E4-scFv fusion construct used in the invention. The constructused in the invention.
                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                      The VK sequence is one of 23 (AAR21286-308) expressed from a single chain CC rv library. The library produces a diverse repertoire of antibody CC fragments specific for 2-phenyl-5-oxazolone (phox). It was prepd. using CC DNA generated from mRNA from mice immunised with phox coupled to chicked Serum albumin. The VH and VL kappa sequences were separately amplified by CC PCR (AAQ23474-84) and ligated into fdCA72 (AAQ23463) for expression on CC the phage surface as fusions with gene III. The resulting library of CC clones was diverse; 23 hapten binding clones were sequenced revealing 8 CC VH genes (A-H; AAR21264-71) in a variety of pairings with 7 VK genes (a-g AR21286-92). Most clones were VH-B combinations so a further CC repertoire. The resulting library was screened for hapten binding and 24 CC clones sequenced. 14 new partners (AAR21293-308) for VH-B were CC identified. Nearly all the VK genes were "ox-like; only f, (from the CC values found. This suggests that phage bearing scFv fragments having weak affinit- ies can be selected with antigen, probably due to the avidity of CC values found. This suggests that phage bearing scFv fragments having weak CC uniting antibody heads on the phage. The different combinations CC could also be isolated on a basis of antigen affinity. ```
The VK sequence is one of 23 (AAR21286-3be) expressed from a single chain CC Fv library. The library produces a diverbe repertoire of antibody CC fragments specific for 2-phenyl-5-oxazobbne (phox). It was prepd. using CC cDNA generated from more from mice immunised with phox coupled to chicked cc serum albumin. The VH and VL kappa sequences were separately amplified by CC pCR (AAQ23474-84) and ligated into fdCATB (AAQ23463) for expression on CC the phage surface as fusions with generality. The resulting library of CC clones was diverse; 23 hapten binding clbnes were sequenced revealing 8 CC yH genes (A-H; AAR21264-71) in a variety of pairings with 7 Vk genes (a-g ; AAR21286-92). Most clones were VH-B combinations so a further CC clones sequenced. 14 new partners (AAR21291-308) for VH-B were CC clones sequenced. 14 new partners (AAR21291-308) for VH-B were CC identified. Nexrly and h, p, q, and r (from the hierarchical library) were Vkox1 type genes. Of the 24 hierarchical clones, one was of type "j". The CC VH-B Vk-d for phox-cABA was 10 nM, one of the highest values found. CC can be selected with antigen, probably due to the avidity of the multiple can be selected with antigen. The different combinations could also be isolated on a basis of antigen affinity. See also AAR21260-307, 309-311; vc.

                      The VK sequence is one of seven (AAR21286-92) found to be expressed from a single chain FV library from an immunised mouse. The libra- ry produces a diverse repertoire of antibody fragments specific for 2-phenyl-5- oxazolone (phox). It was prepd. using cDNA generated from mRNA from mice immunised with phox coupled to chicked serum albumin. The VH and VL kappa sequences were separately amplified by PCR (see AAQ23474-84) and ligated into fdCAT2 (see AAQ23463) for ex- pression on the phage surface as fusions with gene III. The result- ing library of clones was diverse. Twenty three hapten binding clones were sequenced revealing eight different VH genes (A-H) (see AAR21264-71) in a variety of pairings with the seven different VB genes (a-g). Of the twenty three clones sequenced, two were of type "C", and were "ox-like" genes. (See Berek et al, Nature 316 412-418, 1985). They contain the DXGXX motif in CDR3, the central Gly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 10-JUL-1990;

The Kd of VH-B/Vk-b for ph0x-GABA was 10 uM, one of the highest values found. This suggests that phage bearing scFv fragments having weak affinities can be selected with antigen, probably due to the avidity of the multiple antibody heads on the phage. The library produces a diverse repertoire of antibody CC fragments specific for 2-phenyl-5-oxazolone (phox). It was prepd. using CC cDNA generated from mRNA from mice immunised with phox coupled to chicked CC serum albumin. The VH and VL kappa sequences were separately amplified by CC PCR (AAQ23474-84) and ligated into fdCAT2 (AAQ2343) for expression on CC the phage surface as fusions with gene III. Favor for expression on CC the phage surface as fusions with gene III. Paralled revealing 8 (CV H genes (A-H; AAR21264-71) in a variety of pairings with 7 Vk genes (a-g. AAR21286-92). Most clones were VH-B combinations so a further CC interarchical library was prepd. by "crossing" VH-B with the Vk Clones sequenced. 14 new partners (AAR21293-908) for VH-B were CC identified. Nearly all the Vk genes were "Ox-like"; only f. (from the CC coriginal library) and h, p, q, and r. (from the hierarchical library) were CC values found. This suggests that phage bearing scFv fragments having weak affinit- ies can be selected with antigen, probably due to the avidity of CC the multiple antibody heads on the phage. The different combinations CC could also be isolated on a basis of antigen affinity. See also AAR21260-307, 309-311; AAR22450, 565-581

Therapeutic agents can be formulated with the antibody for treatment of HBV infections by stopping proliferation of the virus through inhibition of viral DNA synthesis, and the gene encoding the antibody can be applied

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC Polypeptides which specifically recognise human IgE receptor (Pc-epsilon CC -RI) have been isolated and sequenced. The new peptides are related to a CC monoclonal antibody against Fc-epsilon-RI and are either heavy or light CC chain molecules. The heavy chain molecules have the general formula FRI-CC CDRIH-FR2-CDR2H-FR3-CDR3H-FR4 (corresp. to AAR79153, AAR79155, AAR79157, CC AAR79159 and AAR79161) and are encoded by AAQ96280, AAQ96282, AAQ96284, CC AAQ96286 and AAQ96288. FRI is a polypeptide having 29-36 amino acids CC (aa), FR2 is a 10-16 as polypeptide, FR3 is a 33-35 as polypeptide and FR4 CC is a 12-14 as polypeptide. Similarly the light chains have the general CC formula FR5-CDR1L-FR6-CDR2L-FR7-CDR3L-FR8, (corresp. to AAR79154, CC AAR79155, AAR79156 and AAR79150 and AAR79152) and are encoded by AAQ96281, CC AAR79155, AAR79158, AAR79150 and AAR79162) and are encoded by AAQ96281, CC CR6 is a 14-16 as polypeptide. FR7 is a 30-34 as polypeptide, CC CR6 is a 14-16 as polypeptide. FR7 is a 30-34 as polypeptide and FR8 is a CC GR6 is a 14-16 as polypeptide. All the peptides are derived from mouse hybridoma CC cells and are useful in the detection of the human FC-epsilon-RI or for the elucidation of an antigen recognising region of a monoclonal antibody CC against human FC-epsilon-RI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a multifunctional polypeptide comprising a commain with a binding site that specifically recognises an extracellular composition of the NKG2D receptor complex and a second domain which functions can a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmune confusions. The cancer may be a tumour of the head and neck, stomach, compositions. The cancer may be a tumour of the head and neck, stomach, complying colon, liver, intrahepatic bile ducts, pancreas, lung, colon, liver, intrahepatic bile ducts, pancreas, lung, colon, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, complete or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, correctious diseases can be caused by viruses, bacteria, fungi, corrections, Grave's disease, ankylosing spondylitis, acute anterior cuveitis, Goodpasture's syndrome, myasthania gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and contoinmune hepatitis. Sequences AU772875 represent the NKG2D contoinmune hepatitis. Sequences AU772875 represent the NKG2D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a multifunctional polypeptide comprising a CC domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions CC as a receptor or ligand. The polypeptide and its associated CC composition for the treatment of cancer, infections and/or autoimmune CC compositions. The cancer may be a tumour of the head and neck, stomach, CC compositions, liver, intrahepatic bile ducts, pancreas, lung, CC larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, CC larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, CC larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, CC larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, CC protozoa or helminths. The autoimmune diseases include multiple CC scientis, Goodpasture's gridences, ankylosing spondylitis, acute anterior CC uveitis, Goodpasture's syndrome, myssthenia gravis, insulin-dependent CC diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatitis. Sequences AAU7280-AAU72875 represent the NKG2D creative and the rolly account of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the

XX New isolated antibody that neutralizes botulinum neurotoxin type A, PT useful for diagnosing botulism or for treating pathologies associated PT with botulinum neurotoxin poisoning.

XX Example 1; SEQ ID NO 95; 110pp; English.

XX The invention describes an isolated antibody (I) that specifically binds CC to an epitope specifically bound by an antibody expressed by a specific CC clone where (I) binds to and neutralises botulinum neurotoxin type A (BONT/A). An isolated antibody (I) that specifically binds to an epitope composition (II) that positiops (II) and INGI, where (I) binds to and neutralizes botulinum composition (II) and neutralizes botulinum neurotoxin type A (BONT/A). Also described are: a polypeptide (II) comprising BONT/A neutralising epitope that is specifically bound by an antibody expressed by clones as mentioned in (I) comprising (I); and a composition (III) comprising several anti-composition (II) producing (I); and a composition (III) comprising several anti-comprising (I); and a composition neutralisation than the combination of antibodies howe greater toxin neutralisation than the combination of antibodies comprising (I); and a kit comprising (I). (I) is useful for neutralising CC antibodies shows greater toxin neutralisation than the combination of antibodies associated with (I) in surplus. Where each of (I) is specific for a different epitope of the botulinum neurotoxin and the combination of antibodies in surplus. (I) is useful for diagnosing the botulism or treating pathologies associated with botulinum neurotoxin and the combination of antibodies associated with botulinum neurotoxin acid cepton or diagnosis of botulinum neurotoxin acid cepton or diagnosis of botulism. This is the amino acid cepton.

Sequence of a mouse light chain variable fragment anti-botulinum toxin extends the combined of the combined or diagnosis of botulinum coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin coxin

                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                 र्
                                                                                                                                                                                                           片
                                                                                                                                                                                                                                       ঠ
                                                                                                                                                                                                                                                                                                                                                                                  The VK sequence is one of 23 (AAR21286-308) expressed from a single chain CC Fv library. The library produces a diverse repertoire of antibody CC fragments specific for 2-phenyl-5-oxazolone (phOx). It was prepd. using CC DNA generated from mRNA from mice immunised with phOx coupled to chicked serum albumin. The VH and VL kappa sequences were separately amplified by CC PCR (AAQ23474-84) and ligated into fdCRT2 (AAQ23463) for expression on CC the phage surface as fusions with gene III. The resulting library of CC clones was diverse; 23 hapten binding clones were sequenced revealing 8 CC VH genes (A-H; AAR21264-71) in a variety of pairings with 7 VK genes (a-g AR21286-92). Most clones were VH-B combinations so a further CC repertoire. The resulting library was screened for hapten binding and 24 CC clones sequenced. 14 new partners (AAR21293-308) for VH-B were CC vkox1 type genes. Of the 24 hierarchical clones, two were of type "o". CC VKox1 type genes. Of the 24 hierarchical clones, two were of type "o". CC viginal library) and h. p. q. and r. (from the hierarchical library) were CC vkox1 type genes. Of the 24 hierarchical clones, two were of type "o". CC viginal library) and h. p. q. and r. (from the hierarchical library) were CC vkox1 type genes. Of the 24 hierarchical clones, two were of type "o". CC viginal library and h. p. q. and r. (from the hierarchical library) were CC cound. This suggests that phage bearing scPv fragments having weak CC affinit- ies can be selected with antigen, probably due to the avidity of CC cound also be isolated on a basis of antigen affinity. See also AAR21260-CC 307, 309-311; AAR22450, 565-581

                                                                                S
                                                                                                                                                                                                 The invention relates to a method of identifying binding site domains CC (BSD) that retain the capacity of binding to a predetermined epitope when CC positioned C-terminal of at least one further domain in a recombinant bic or multivalent polypeptide. The method domprises (a) testing a panel of CC BSD displayed on the surface of a biological display system as part of a CC fusion protein for binding to a predetermined epitope, where the fusion CC protein comprises an additional domain positioned N-terminal of the BSD CC and an amino acid sequence that mediates anchoring of the fusion protein to the surface of the display system; and (b) identifying a BSD that CC binds to the predetermined epitope. The method is useful to identify bic cor multivalent polypeptides that comprise antibody binding sites capable of efficiently binding to the corresponding antigen. The polypeptides or CC diagnostically, for e.g. cancer and autoimmune diseases. ScFv-antibody CC fibraries using the new in vitro method. Sequences AAY17957-965 represent CC mouse scFV fragments

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score
